6. Using the information in the introduction, explain why Tay-Sachs would affect more males than females if it was a sex-linked disorder.

Tay Sachs would affect more males than females if it was sex-linked because men carry the y chromosome which makes them more likely to have it because they carry a different sex chromosome than women do.

Student Response

Tay Sachs would affect more males than females if it was sex-linked because men carry the y chromosome which makes them more likely to have it because they carry a different sex chromosome than women do.
