**Public Comment:** Engineering, science and technology salaries are the highest paid by far coming out of college. Starting average is \$55,000 and rises quickly from there. That education starts in the 9th and 10th grade. But kids demand hands-on, real world training, not just simply reading and theory. Don't we all? The reality is STEM style education has proven success at all levels in this arena, and our state in particular needs more success in the charter school arena. We need to do all we can to help this program get started. We need the support from our state officials. We need to give our children the best possible futures we can in jobs that will provide great wages and make our state one companies come to because they can find these skills. When the state shows it believes in it, companies with high paying jobs will come here. We need that.

This STEM school will be the place that gives Delaware and our children what they need to succeed in this changing world. We can do this. We need to do this.
